

I came across this link and I thought I would share it with you to test your website in the following areas, performance, mobile friendly, SEO, security!

### **How Website Grader Works**

Just go to the website, you put in your URL or your domain name. For example, I put in [www.ipmg.net.au](http://www.ipmg.net.au). If you want, you can also put in your email address, but that's optional. Once you put in your domain name, click on the **"Grade my website"** button, then wait for about 10 seconds. A bunch of robots will be assessing your website, then it effectively generates a report saying how good or bad your website is based on a number of different factors.
